Adding Style to components

There are two ways you can include styles in React Component

1. Including a css file

- React components finally get translated to html by ReactDOM
- We can include standard CSS and use them using **className**

  ```
  <div className='header' />
  ```

- Note
  - You can include className only for builtin react components and not your own
  - Your component doesn't know the className and you must write your logic to manage it

We can include css file in two different ways

1.1 Include your css in index.html

1. Put your CSS file in public folder
2. Include in using <link> tag in index.html like you always do.

1.2 import your css in index.js

2. Include style as JavaScript object
